

QuantEdge

How to use QuantEdge

A plain-English guide to the trading research terminal —

Today, NEXUS, FLOW, GEX, Chart, Quantum, Quantum Bot and the Journal.

MEASURED, NOT PROMISED.

CONTENTS

What is in this guide

- 7 Phone tips 26
- 8 Keyboard shortcuts 28
- 9 What is measured — and what is not 30
- 10 Glossary 31

How to read this guide

New? Read sections 1–3 (about 15 minutes), then keep section 4 open while you use the terminal. Section 5 teaches GEX in five minutes. Section 9 tells you what the numbers can and cannot prove. Every screenshot was captured from the QuantEdge test harness and shows **sample data** — synthetic fixtures, not market data. Some panels in the screenshots show a “didn’t load” state because the harness has no data for them; that is what a real feed outage looks like too. A few screenshots may still show older labels (“Nexus”, “Bot”, “Run engine”) where this guide uses the current names (NEXUS, Quantinum Bot, Run Quantinum).

SECTION 1

What QuantEdge is

A trading research terminal for stocks, options and crypto. Every number carries its evidence and its record.

QuantEdge is where you look before you trade. It does not place orders, hold your money or tell you what to buy. It gathers what can be measured — where options dealers are positioned, what large options buyers are doing, which setups have enough independent evidence behind them — and shows you each piece with its source and its age.

The platform is built around three jobs, and each area of the terminal does one of them:

JOB	WHERE	WHAT YOU GET
See the positioning	GEX · FLOW	Dealer gamma walls, zero-γ flip and king nodes (GEX); the live options-flow tape, sweeps, blocks and whales (FLOW).
Rank the setup	NEXUS · Quantum	NEXUS is the trading desk: every setup ranked by its evidence, with entry, stop and target printed. Quantum weighs every engine's evidence for a ticker and shows each layer's argument.
Prove the record	Quantinum Bot · Journal	Quantinum Bot trades NEXUS's published ideas on paper and keeps a record of every fill. Your Journal imports your broker trades and tells you what to stop doing.

Product names

NAME	WHAT IT IS
QuantEdge	The platform — the terminal as a whole (the company is QuantEdge Labs).
NEXUS	The trading desk: ranked setups, setup detail, the BOARD · 0DTE desk and the horizon book.
Quantinum	QuantEdge's intelligence: the evidence-weighting read on each ticker (verdict + layers), conviction explanations, the Run Quantum button.
Quantinum Bot	The paper-trading bot. Paper only — no real money is ever involved.

Measured, not promised

Five house rules run through the whole product:

- **Measured, not inferred.** Every idea comes from a scanner that measured something — options bought at the ask, a dated bottom, a real pullback. No invented levels.
- **Coherent with itself.** A setup may not contradict its own tape. Opposing flow subtracts points.
- **Live, not carried forward.** Anything shown as current is recomputed now or labelled with its age.
- **Long and short on equal footing.** Shorts clear the same evidence bar as longs.
- **Judged by the record.** Every published idea's outcome is tracked; scanners that do not pay get demoted by their own numbers.

SECTION 2

Your first 10 minutes

Sign in, read Today, open one ticker, star it. That is the whole loop.

MINUTE	DO THIS	WHY
0–1	Go to quantedgelabs.net and sign in. New members sign up with their email and the one-time invite code they were sent.	Signup is invite-only; your journal, watchlist and settings are private to your account.
1–2	On iPhone: open the site in Safari → Share → Add to Home Screen . It then runs full-screen like an app.	The phone layout has its own dock and bottom sheets (section 7).
2–5	Open Today (first item in the sidebar). Read the headline sentence, the dealer map for SPY this week, and the pre-market gaps strip.	Today is the morning brief: regime, the week's levels and the best idea in one scroll.
5–8	Press ⌘K (Ctrl+K on Windows), type a ticker such as NVDA and press Enter.	Every ticker has one page, /r/NVDA : price, Quantum read, dealer map, chart, setups and news.
8–10	Tap the ★ next to the ticker. A toast confirms it — with Undo if you mis-tapped.	Starred tickers form your watchlist. Scanners, alerts and the pre-market strip follow it.

Today on a desktop. Left: the sidebar (Start · Trade · Research · Manage). Top: sector tape and the Pre-Market Gaps strip. Centre: the week's dealer read for SPY — magnet, ceiling (call wall) and floor (put wall). **Sample data** — test-harness fixtures, not market data.

The sidebar in one line each

- **Start** — Today.
- **Trade** — NEXUS (ranked setups and the 0DTE desk), FLOW (options flow), GEX (dealer positioning).
- **Research** — Chart, LEAPS, Crypto, Catalysts.
- **Manage** — Quantinum Bot, Positions, Journal.
- Bottom: Alerts, Guide (this guide, online) and Settings.

SECTION 3

A trading day, start to finish

One routine that uses the terminal well. Times are New York (ET).

WHEN	WHERE	WHAT TO DO
Before 9:30	Pre-market strip on Today	Scan the gaps. A gap in the direction of a book idea confirms it; a gap against it means the setup may already have moved without you. A gap through an idea's stop overnight cancels it before the open.
9:00–9:30	Today	Read the headline (e.g. "SPY is in long gamma. Moves get dampened."), the week's magnet, ceiling and floor, and Today's best idea . Note the ranked book's long/short balance.
9:30–10:00	NEXUS · BOARD	Let the open settle. Open the ranked setups. For any you like, read the setup detail: trigger, invalidation (stop), first target, and the evidence chips. WATCH / pending means not a trade yet.
Intraday	NEXUS · ODTE	For same-day ideas, switch the segment to ODTE . Ideas move WATCH → TRIGGERED → IN PLAY → DONE. TRIGGERED means the trigger printed — enter now or skip.
Before entry	GEX	Check where the walls, zero-y and king node sit relative to your entry and target. A target beyond the call wall in positive gamma is a big ask.
Before entry	FLOW	Is big money trading with you? Filter the tape to your ticker; look at sweeps, repeat flow and the calls/puts premium tide.
In the trade	Chart	Draw your levels (Alt+H for a horizontal line), turn on GEX layers, and watch price against the stop. The stop is the thesis.
After the close	Journal	Import your broker CSV, then read Insights ("what to stop doing") and Loss analysis for any red trade.

The Pre-Market Gaps strip on Today. Each chip says whether the gap confirms or argues against a book idea; ★ marks your watchlist names. **Sample data** — test-harness fixtures, not market data.

Reading an idea — the five things on every card

- **Band and score.** S is strongest, then A, B, C. The number is the total of every evidence layer.
- **Status.** Pending / WATCH is not a trade. It becomes one only if price takes out the entry during market hours.
- **Evidence chips.** Each chip is one measured reason. Red chips argue against the idea and subtract points — you see both sides.
- **Levels.** Entry, stop, T1. The stop is a price that actually printed; T1 is a real level or a plainly stated 2R.
- **The tape.** ✓ big money is buying with the idea; ✗ it is selling against it.

SECTION 4

Area by area

One or two pages per area: what it is for, how to read it, key terms and common questions.

4.1 Today

What it's for. The morning brief. One scroll tells you the regime, the week's levels for SPY, the best idea and the book.

How to read it

- **Tape** — sector ETFs and their day change.
- **Pre-Market Gaps** — pre-market price vs prior close; confirms / against the book.
- **Week dealer map** — a one-sentence read (“SPY is in long gamma...”), the typical weekly move ($\pm 1\sigma$), and three numbers: **Magnet** (max |gamma| strike), **Ceiling** (call wall), **Floor** (put wall).
- **Index desk, Today's best idea, Ranked book, Rotation, Crypto, Model record and Book stats** follow below.

Key terms

TERM	MEANING
Freshness dot	The small • with an age (e.g. “• 2m”) on every tool. Grey = fresh (under 5 min). Amber = aging (5–30 min) or a degraded feed. Red = stale (over 30 min).
1σ weekly move	One standard deviation — a typical week. The page says whether it came from realized or implied volatility.

Common questions

Is Today the same for everyone? The market read is; the pre-market strip and book emphasise your watchlist.

Why does Today not let me move tools around? Only GEX and FLOW are editable workspaces. Every other page is a fixed, curated layout.

4.2 NEXUS — the trading desk

What it's for. Every setup ranked by its evidence, with entry, stop and target printed. Two views, chosen by the segment at the top: **BOARD** and **0DTE**.

NEXUS · BOARD: ranked setups, setup detail with trigger / invalidation / first target, and market context. **Sample data** — test-harness fixtures, not market data.

How to read it

- **Ranked setups** (left) — filter ALL / LONG / SHORT and ALL / NEW / BEST / CONVICTION; LIST, GRID or TABLE; search by ticker. Click a row to load it.
- **Setup detail** (centre) — the chart with walls, live price, trigger, invalidation (stop), first target, and tabs: Overview · Technical · Manage · Risk.
- **Market context** (right) — regime score, macro risk, preferred side, VIX.
- Below: **Trader calls**, **Developing candidates** and your **Positions**. The **Book by horizon** tool filters by holding period (default set in Settings).

Key terms

TERM	MEANING
Conviction score	The sum of every evidence layer's points (raw points, roughly 0–60). Red layers subtract.
Band	$S \geq 25 \cdot A \geq 19 \cdot B \geq 13 \cdot C$ below 13. S: many layers agree, nothing strong argues against. A: solid, a minor objection. B: watch — wait for the trigger and the tape. C: usually a skip.
Pending / In play	Pending: waiting for the entry to trade in market hours. In play: the trigger printed.
Invalidation	The stop — the price that proves the idea wrong.

The 0DTE desk (NEXUS · 0DTE)

- A **session clock** — open drive, midday, power hour — and what the engine looks for in the current phase.
- **0DTE ideas first**, each with its exact contract, live premium, trigger, stop, targets and a deadline.
- Per tracked name (default SPX · MSTR · META · BE · TSLA): spot, today's expected move (ATM straddle of the nearest expiry), same-day-expiry GEX levels, VWAP and opening-range state, the flow tide on that expiry, and the engine's state in plain words.
- **Short swings** (2–4 days) per name, and this engine's own record with n, flagged **LOW N** when the sample is small.

STAGE	MEANING	WHAT YOU DO
WATCH	Forming; the trigger has not printed. Shows how far away it is.	Nothing yet. Note the trigger.
TRIGGERED	The trigger printed — enter now.	Decide: take it at the live premium, or skip.
IN PLAY	Logged and running.	Manage against the stop and deadline.
DONE	Resolved (target, stop, deadline).	Review it in the record.

Common questions

Why is a great-looking setup still WATCH? Because the trigger has not printed. Nothing enters overnight; ideas found after the close publish as triggers, never as trades already taken.

Why did a card disappear? A tape flip retires the opposite-side card so you never see a long and a short on the same name side by side.

4.3 FLOW — the options-flow workspace

What it's for. The live options tape: who is buying and selling, how big, how urgent. FLOW is a **workspace** — you can add, move and resize tools.

*FLOW: the Options Flow tape with filter chips, the premium tide, key levels and dark-pool levels. The yellow “didn't load” panels show an honest feed failure — not an empty result. **Sample data** — test-harness fixtures, not market data.*

How to read it

- **Options Flow** — every print in the window: time, premium value, ticker, strike, call/put, expiry, price, size, vol/OI. The header shows the calls vs puts premium tide, sweep % and P/C.
- **Filter chips** — ETFs, Stocks, Sweeps, Calls, Puts, Unusual, Urgent, Position Builders, Sizable, Grenade, 100k+, Whales, LEAPS, ODTE, High Sig, Repeat Flow, Large Size.
- Clicking a row re-points the terminal to that ticker. Two layouts ship: **Market flow** and **Ticker flow** (chart, net flow by strike, flow × GEX convergence, strike × expiry, timeline, dark pool).
- Workspace bar: **Add tool**, **Auto-arrange**, **Restore default**, **Clear**, and a dashboard switcher for named layouts. Changes save automatically.

Key terms

TERM	MEANING
Sweep	An order split across exchanges to fill fast — urgency.
Block / Grenade	A single large print.
SigScore	A 0–1 ordering of how notable a print is: 40% size, 20% aggression, 20% repeat, 20% vol/OI. An ordering — not a probability, not a direction.
Vol/OI	Today's volume ÷ open interest. Above 1× suggests new positions opening.

Common questions

Why is there no Bid/Ask filter? Neither feed measures the aggressor side per print, so the filter is hidden rather than faked.

4.4 GEX — the dealer-positioning workspace

What it's for. Where options dealers are likely to buy or sell as price moves: the walls, the flip and the pin. Also a **workspace**.

GEX workspace: the strike x expiry matrix (SPOT and ZERO-γ rows marked), key levels, and the regime narrative. Sample data — test-harness fixtures, not market data.

How to read it

- Strike x expiry matrix** — each cell is dealer gamma (\$ per 1% move) at one strike and expiry. Blue = positive, orange = negative. Filter by DTE (0–7d, 7–30d, 30–90d, 90d+); switch GEX / VEX; colour per expiry or absolute. Click a cell to drill in.

- **Key levels** — call wall, put wall, magnet (max $|\gamma|$ strike), zero- γ flip, net VEX, net GEX.
- **Regime & narrative** — positive / negative gamma in words, what dealers do, and “if price holds inside” vs “if a wall breaks”.
- Also in the default layout: chart, dealer map and gamma profile. **Squeeze Radar** can be added from Add tool.

Key terms

TERM	MEANING
King node	The biggest cell (largest $ \text{value} $) in each expiry column — highlighted; #2 and #3 get an outline. Often the pin in positive gamma.
Zero-γ (flip)	The price where total dealer gamma crosses zero, found by re-pricing every option across hypothetical spot prices.
Call wall / put wall	Strike above spot with the largest call gamma (often resistance) / below spot with the largest put gamma (often support).
VEX	Vanna exposure — how dealer hedging changes when implied volatility moves. \$ per IV point.
Squeeze Radar	A 0–100 score and stage (quiet, building, primed, igniting, exhausted, illiquid) for single-stock gamma squeezes. Unvalidated — measuring.

4.5 Chart

What it's for. A TradingView-style chart with drawing tools, indicators and dealer layers.

The Chart tab: drawing tools on the left, dealer levels (walls, zero-γ) on the price axis, status bar with ET clock and RTH/ETH. **Sample data** — test-harness fixtures, not market data.

How to read it

- Top bar: symbol, timeframe, chart type (candles, bars, line, area), Indicators, Replay, undo/redo, snapshot, fullscreen.
- Left bar: trend line, ray, horizontal line and ray, vertical line, parallel channel, Fib retracement, rectangle, brush, text, arrow, price-range measure; magnet, lock, hide and remove all.
- Layers: dealer levels (walls, zero-γ), GEX, dark-pool and flow. Status bar: range presets, live stamp, ET clock, RTH/ETH, %, log.
- Drawings are saved per user, per symbol. On a phone the tools fold into a $\cdots$ sheet; two-point tools are tap-tap.

4.6 The ticker page (/r/SYMBOL)

What it's for. Search any ticker and you land on one page with everything about it, in the order a trader asks.

The ticker page for SPY: header with Watch / Alert / Run Quantum, key stats, dealer map for the week and the chart. **Sample data** — test-harness fixtures, not market data.

How to read it

- **Header** — one live price with its provider and age (“delayed” when it is). Actions: Watch (★), Alert (a level; fires once), **Run Quantum**.
- **Quantum read** — one verdict line (▲ Bullish / ▼ Bearish / ♦ Mixed / Quiet), bull and bear evidence, and the two heaviest layers.
- **Key stats** — volume vs 20-day, ATR, RSI, 52-week range, short % float, 30-day return. **Dealer map** — call wall, put wall, zero-y, regime, week 1σ move, next earnings.
- Sections: Overview · Options · Setups · Evidence · Peers · News, plus deep views **GEX surface** and **Contract lab** (paste any contract).

Common questions

Why is the win rate missing on Setups? A name’s record is shown over the last 20 sessions; the win rate is withheld until 30 outcomes are decided.

Why is Evidence collapsed? The verdict line already carries the headline; open Evidence to see every Quantum layer with its points, reason and source — and what was not measured.

4.7 Research: LEAPS, Crypto, Catalysts

What it's for. Longer horizons and the calendar.

Crypto: structure lab chart and BTC / ETH spot reads. *Sample data — test-harness fixtures, not market data.*

How to read it

- **LEAPS** — long-dated option ideas with a budget filter and grade distribution; sized as an allocation (Settings → Capital per idea), not a stop.
- **Crypto** — BTC/ETH spot and chart, the equity-proxy gate (COIN, MSTR, IBIT...), sentiment and correlation. A proxy needs its own tape to confirm — the coin moving is never enough.
- **Catalysts** — earnings and the economic calendar, distance to the next event, and a signal-impact board.

4.8 Quantum Bot

What it's for. Quantum Bot trades NEXUS's published ideas **on paper** and keeps a record of every fill. It never touches real money.

How to read it

- Top: stats (jobs, rules enforced, latest scan, validation hold).
- Paper book (open positions), ledger, outcomes, jobs and history.
- Every closed paper trade feeds the record — the same record the Journal can show as the “Quantum Bot” book.

4.9 Positions

What it's for. Your open book at a glance.

How to read it

- P&L strip, a heat map by position, best / worst, the long/short and asset mix, and a full positions table with alerts and stops.

4.10 Settings

What it's for. Your profile, how the terminal looks, trading defaults, alerts, connections and your data. It is also where to download this guide.

Settings: jump links (including “User guide (PDF)”), Profile and the Display mode picker. **Sample data** — test-harness fixtures, not market data.

How to read it

- **Display** — five modes: Dark (default), Midnight (true black for OLED), Dim, Light, High contrast. Text size (Standard, Large, Extra large), Density, **Calm mode** (no motion or glow) and Clock (New York or this device).
- **Trading defaults** — default horizon; **Account size**, **Risk per trade** (0–10%), **Options budget** and **Capital per idea**. Signals size from these numbers. The **Watchlist** is managed here too.
- **Alerts**, **Connected accounts** (read-only — QuantEdge never places orders), **Journal** defaults and **Data & privacy** (export or remove your journal).

SECTION 5

Reading GEX in 5 minutes

Dealers who sell options hedge by trading the stock. Where they hold gamma tells you whether they will cushion moves or chase them.

Step 1 — What gamma exposure is

When you buy an option, a dealer usually sells it and then hedges by buying or selling shares. Gamma is how fast that hedge must change as price moves. GEX adds it up across every strike and expiry: **dollars of stock dealers must trade for each 1% move**. QuantEdge assumes the textbook book: dealers long calls (+) and short puts (-).

Step 2 — The regime: positive vs negative gamma

Illustration. Positive gamma (+γ): dealers buy dips and sell rips, so ranges tighten and price tends to pin. Negative gamma (-γ): dealers chase the move, so ranges widen and trends can run.

REGIME	DEALER BEHAVIOUR	WHAT IT TENDS TO MEAN FOR YOU
Positive (+γ)	Buy dips, sell rips — stabilising.	Fade extensions toward walls; expect pinning to the king node; breakouts need confirmation.
Negative (-γ)	Sell into drops, buy into rips — amplifying.	Moves travel further; respect momentum; stops need room.
Near the flip	Spot within 1% of zero-γ.	Regime can switch quickly — the sign still shows, with the words “near the flip”.
Neutral	Net gamma under 5% of gross.	No strong dealer force either way.

Step 3 — The levels

Illustration with made-up numbers: net GEX by strike. Blue bars add stabilising gamma, orange bars take it away. The call wall is ranked by call gamma alone, so it need not be the tallest net bar.

- **Call wall** — the strike above spot with the most call gamma. Price often stalls there (the “ceiling” on Today).
- **Put wall** — the strike below spot with the most put gamma. Often support (the “floor”).
- **Zero-γ (flip)** — above it dealers are usually long gamma (calm); below it short gamma (fast). Losing the flip is a regime change.
- **King node** — the biggest cell in an expiry. In positive gamma it acts like a magnet into that expiry.

Step 4 — A five-minute routine

- Open GEX, pick the ticker. Read the regime card first (sign and words).
- Note spot’s position between the put wall, zero-γ and the call wall.
- In the matrix, find the king node in the nearest expiries (0–7d filter).
- Ask: is my target beyond a wall? Is my stop on the wrong side of the flip?
- Check FLOW: is fresh buying moving the wall (e.g. calls stacking higher strikes)?

What GEX cannot tell you

Open interest does not say who is long. The +calls/–puts assumption fails in known cases — in a retail call-buying squeeze the map can show stabilising gamma exactly where dealers are short. OI is yesterday’s, so options opened and closed today (most ODTE) never appear. Treat walls as zones where hedging is likely, not guarantees.

SECTION 6

The Journal: import, Insights, Loss analysis

Your trades, measured the same way the platform measures its own ideas.

Books

The switcher at the top of the Journal chooses a **book**: **Mine** (your trades), **Quantinum Bot** (paper), **NEXUS ideas** (the platform's published ideas) and imported trader journals. Every page and filter works on whichever book is selected.

Pages: Overview (Dashboard, Calendar, Daily) · Trades (Trades, Missed) · Insights (Insights, Reports, Loss analysis) · Improve (Playbooks, Progress, Notebook) · Setup (Import, Accounts, Settings) · Platform (Track record, Trader ranking).

Journal dashboard: net P&L, win rate, profit factor, expectancy, drawdown, streak, and the cumulative P&L curve. **Sample data** — test-harness fixtures, not market data.

Importing a broker CSV (Webull and others)

STEP	DO THIS
1	Export a CSV from your broker (below).
2	Journal → Import → drop the file onto “Drop a broker CSV or click to browse”. The broker is detected automatically.
3	Read the reconciliation: trades added, duplicates skipped, rows that did not parse and why.
4	Open Trades to review; edit anything (every edit has Undo).

BROKER	WHERE THE EXPORT LIVES
Webull	Account → History → Export Orders
Robinhood	Statements & History → Download CSV
Schwab	Accounts → History → Export
IBKR	Reports → Flex Queries → Trade Confirm
tastytrade	History → Trade History → Export
Also detected	TD, Fidelity, E*TRADE

Other ways in

Log a trade manually; connect Alpaca for a read-only fill import; paste Bullflow alerts to grade them. Discord trader journals (a forum of traders' threads) are imported by the operator; they appear as trader books and in Trader ranking. Only .csv files up to ~3.5 MB are accepted. Duplicates are always skipped.

Insights — “what should I stop doing?”

- **01 What to stop doing** — every bucket that lost money (at least 5 trades), ranked by \$, with win %, profit factor, a both-halves check and your book without it.
- **02 Behaviour** — headline findings in sentences (e.g. trades after a loss vs after a win).
- **03 When** — weekday × hour heatmap (ET), time of day, weekday.
- **04 Tilt & streaks** — quick re-entries, trade # of the day, trades per day, streaks.
- **05 What you trade** — DTE, premium size, holding time, contract side. **06** Ticker concentration.

Journal · Insights on sample trades: the filter bar, “What to stop doing”, Behaviour findings and the time-of-day view. **Sample data** — test-harness fixtures, not market data.

Loss analysis — why each loss happened

For every closed losing trade, QuantEdge reads real price bars of the underlying and measures the best and worst excursion (MFE/MAE), whether it was ever in profit, and what happened after the exit. Each loss gets one class by an explicit rule shown next to its count:

CLASS	RULE (SHORT)	LESSON
Gave back a winner	Was up $\geq$ the give-back threshold (in R) yet closed red.	Take partials / move the stop to break-even once +1R prints.
Stop too tight	Stopped out, then the underlying reached the target anyway.	Size down and widen the stop (ATR-based).
Late / after-hours entry	Entered outside 09:30–16:00 ET and the next bar opened against you.	Re-price at the open or skip.
Theta / decay	Underlying flat or moved your way, but the option still lost.	More DTE or less premium: spreads, or stock.
Target too far	Neither stop nor target printed before a time exit.	Targets the move can reach in the horizon.
Wrong direction	Never meaningfully in profit.	The read was wrong — check which setup produces these.

CLASS	RULE (SHORT)	LESSON
Ordinary loss	None of the above.	Cost of doing business — judge in aggregate.
Unknown / too short	No bars, or held less than one bar.	Never guessed — judge scalps in aggregate on Insights.

Trader ranking

Imported trader journals are analysed with two kinds of evidence, labelled everywhere: **STATED** (their own P&L, only where a post stated both entry and exit) and **MEASURED** (calls with no stated exit, scored on the underlying's bars after the post — not their P&L). Samples under 20 are flagged.

SECTION 7

Phone tips

The phone layout is not a squeezed desktop — it has its own navigation and reading rules.

Phone (393 px): Today, the GEX phone matrix (4 expiries per page, king nodes highlighted) and FLOW. The dock sits at the bottom. **Sample data** — test-harness fixtures, not market data.

- **The dock** — five destinations, left to right: Today, NEXUS, FLOW, GEX, Chart. Everything else (Research, Manage, Alerts, Guide, Settings) is in the menu button in the top bar.
- **📄 sheets** — descriptions, units, source and full data age live behind the 📄 on each section, so the first screen shows numbers, not paragraphs. Tap 📄 to read them.
- **Freshness** — one compact stamp per section (● 2m). Amber or red means check the age before acting.
- **Swipe expiries** — the GEX matrix shows exactly four expiry columns; swipe left/right on the grid (or use the pager) to page through expiries. Ticker chips at the bottom switch names.
- **Tables** — phones show the 3–4 essential columns; tap a row for the rest.
- **Chart** — drawing tools live in the ⋮ sheet; two-point tools are tap-tap; Indicators open as a bottom sheet.
- **Add to Home Screen** for a full-screen app feel. In Settings, try Large text or Calm mode if the screen feels busy.

Phone: NEXUS ranked setups (BOARD / 0DTE segment at the top), the ticker page for SPY and the Journal dashboard.
Sample data — test-harness fixtures, not market data.

SECTION 8

Keyboard shortcuts

On Windows use Ctrl where this guide shows ⌘.

Anywhere

KEYS	DOES
⌘K	Open / close search: type a ticker (Enter → its page), a page or an action.
⌘1 ... ⌘5	Jump to Today, the Terminal (NEXUS), Research, Positions (Book), Journal.
Esc	Close the search, a sheet or a dialog.
Tab / Shift+Tab	Move focus; every control shows a focus ring.

⌘K search: Go to, tabs and sub-pages, tickers and quick actions. **Sample data** — test-harness fixtures, not market data.

On the chart (focused or hovered)

KEYS	DOES
Alt+H	Horizontal line at the cursor
Alt+T	Trend line
Alt+V	Vertical line
Alt+F	Fibonacci retracement
Alt+J	Horizontal ray
Alt+R	Reset the view

KEYS	DOES
Esc	Cancel the tool / deselect
Del	Delete the selected drawing
⌘Z / ⌘Y or ⇧⌘Z	Undo / redo
← →	Pan
+ -	Zoom

Workspaces (GEX, FLOW)

Tools can be moved and resized with the keyboard as well as by dragging; **Auto-arrange** tidies the grid and **Restore default** returns to the shipped layout.

Two buttons worth knowing

Copy link (the chain icon in the top bar) copies the URL of exactly what is on screen — tab, focus ticker, NEXUS selection, FLOW filters, GEX window — so you can share or bookmark a view.

Undo appears in the confirmation toast after starring or un-starring a ticker, editing or deleting a journal trade, removing a workspace tool, or changing an alert.

SECTION 9

What is measured — and what is not

Read this before you trust any number. It is the most important page in the guide.

TOPIC	THE HONEST ANSWER
The record	Every published idea's outcome is tracked. The outcome tracker was fixed on 2026-08-26; win rates from before that date are invalid and are not shown as the record.
Sample sizes	Every rate carries its n. Win rates are withheld under 30 decided outcomes; small samples are flagged "LOW N" or "SMALL n". A short run of wins is treated as a possible regime artifact until it holds up walk-forward.
Data freshness	Every tool shows its source and age. Option chains can be delayed (~15 min, labelled "delayed"). Publish-time numbers are never shown as current — contracts are repriced live or stamped with their age.
Missing data	A missing input shows "—" or a "didn't load" panel — never a placeholder number. A failed feed is not presented as an empty result.
GEX	Built from public open interest with an assumed dealer book (calls +, puts -). It can be wrong in squeezes; OI is yesterday's; same-day ODTE opened-and-closed is invisible.
Squeeze Radar	Unvalidated — measuring. Components without history show "n/a"; the score says how much of it could be scored.
Odds and SigScore	Odds are market-implied from option prices, not forecasts. SigScore orders prints; it is not a probability.
ODTE timing	Not built for second-by-second scalping: without a real-time exchange feed, do not time a ODTE entry to the second.
Plans	Model plans (ODTE swings, targets) are model output and labelled unvalidated until their record says otherwise.

Not investment advice

QuantEdge is for education and research only. Nothing in the terminal or in this guide is a recommendation to buy or sell any security. Past setups do not guarantee future results. Options can lose their entire value quickly. You decide every trade — size it so a loss you can afford is the worst case.

SECTION 10

Glossary

TERM	MEANING
0DTE	An option that expires today.
1σ (sigma)	One expected move. A target 0.5 σ away is well inside normal range; 1.5 σ is a stretch.
Aggressor tape	Options trades classified by whether the buyer paid the ask or the seller hit the bid.
ATR	Average true range — a typical day's range.
Band (S/A/B/C)	An idea's evidence grade: S $\geq$ 25, A $\geq$ 19, B $\geq$ 13, C below 13 raw points.
Call wall	Strike above spot with the most call gamma; often resistance.
Conviction score	The total of an idea's evidence layers; red layers subtract.
Dark pool	Off-exchange stock prints; shown as levels and prints.
Delta	How much a contract moves per \$1 in the stock.
Expected move	How far the options market prices the stock could move by expiry (ATM straddle or IV).
Freshness dot	• with an age. Grey fresh (< 5 min), amber aging (5–30 min) or degraded, red stale (> 30 min).
GEX	Gamma exposure: \$ of stock dealers trade per 1% move, summed over strikes and expiries.
IV	Implied volatility — how much movement the option price assumes.
King node	The largest GEX cell in an expiry; a pin candidate.
Magnet / max gamma	The strike with the largest net GEX .
MFE / MAE	Best / worst excursion while a trade was open.
NEXUS	The trading desk: ranked setups and the 0DTE desk.
OI	Open interest — contracts outstanding, published once a day.
Pending trigger / WATCH	Waiting for price to reach the entry in market hours. Not a trade yet.
Put wall	Strike below spot with the most put gamma; often support.
Quantinum	QuantEdge's intelligence — the evidence-weighting read on each ticker.
Quantinum Bot	The paper-trading bot; paper only.
R, 2R	Risk units. 2R = the target is twice as far from entry as the stop.

TERM	MEANING
Regime	Positive gamma (stabilising), negative (amplifying), neutral, or near the flip.
SigScore	A 0–1 ordering of flow prints by size, aggression, repeat and vol/OI.
Sweep	An order split across exchanges to fill fast.
Theta	What a contract loses per day from time passing.
TRIGGERED / IN PLAY / DONE	ODTE idea stages after WATCH: enter now / running / resolved.
VEX	Vanna exposure: dealer hedging sensitivity to IV, \$ per IV point.
Vol/OI	Volume ÷ open interest; above 1× suggests opening trades.
VWAP	Volume-weighted average price of the session.
Zero-γ (flip)	The price where total dealer gamma crosses zero.

Product names

QuantEdge — the platform. **NEXUS** — the trading desk. **Quantinum** — the intelligence (the read on each ticker). **Quantinum Bot** — the paper-trading bot. Everything else keeps its plain name: Today, GEX, FLOW, Chart, LEAPS, Crypto, Catalysts, Positions, Journal, Alerts, Guide, Settings.
