

Report v4 — navigation architecture, readability and colour

Question asked: do the pages and navigation correspond and flow, is anything redundant or missing, can every page be seen on every device, and can people actually read it? Method: a systems-engineering V-model — each requirement traced to a test — run on the live platform, then fixes, then the same tests again. Prepared September 24, 2026.

Executive summary

Finding	Before	After	Status
Dead links (lead nowhere)	5	0	Fixed
Stale links (through a retired URL)	11	0	Fixed
Pages with no door	3 (audit, About, public watchlist)	0	Fixed
Duplicate pages	Trade Desk ('0 ideas' beside a full board); Automations (duplicate BOT, \$0.00 P&L;)	Merged / retired	Fixed
Content hidden on iPad / phone	7 columns/sidebars display:none under 1100px	All stacked, visible	Fixed
Ideas first on phone	3rd section, ~9,500px down	1st section	Fixed
Board text under 11px (desktop / iPhone)	81% / 79%	0% / 0%	Fixed
Gain vs loss for colour-blind users (dE, deuteranopia)	15 (barely distinct)	49	Fixed
Accent confusable with 'gain' (dE)	33 (teal ~ green)	101 (brand blue)	Fixed
Live route walk (22 destinations)	—	22/22 render; redirects land correctly	Pass

Part A — Navigation as a system

A1. The V-model

Figure 1. Left side: what the platform must do, decomposed down to code. Right side: the test that proves each level. Dashed lines are traceability — no requirement without a test, no test without a requirement.

A2. Architecture tests (research/nav-architecture.py)

The navigation graph was built from source: 37 routes, 76 redirect rules, 55 distinct link targets from every file. Each link target was resolved against the routes and redirects.

Test	What it asks	Before	After
N1 Dead links	Does every link lead to a page?	5 dead	0
N2 Stale links	Does any link still go through a retired URL?	11	0
N3 Orphans	Is there page code no route renders?	4 files	0 (3 deleted; backtest is embedded in Performance)
N4 No door	Is there a route nothing links to?	3	0
N5 Coverage	Is every surface in the one nav model?	2 nav systems	1 model, terminal + pages + dock
N6 Redundancy	Do two surfaces do the same job?	2 duplicates	0 (merged/retired)

A3. Redundancy decisions

Job	Surfaces	Decision
Rank today's ideas	NEXUS board · Slate · Trade Desk Trade Desk showed '0 ideas / scanning' while the board held 22. Its one unique piece — pre-market gappers — now leads Slate. /trade-desk redirects to /slate.	Merged
Bots	BOT tab · Automations page Automations duplicated BOT and reported +\$0.00 automated P&L; beside a +\$429 paper book. /automations redirects to the BOT tab.	Retired
Chart setups	Radar page · board pattern radar Complementary: the board shows the count; Radar is the full browser.	Kept
Alerts / Settings / Guide	page + terminal drawer Drawer = quick in-context; page = full management. Both reached from the account menu and More.	Kept

A4. Navigation architecture after

Figure 2. One chrome over everything; terminal instruments and pages side by side; research and the workup as the drill-down; retired URLs land on their successor in one hop.

A5. Live route walk

Destination	Landed on	Result
/t	/t	Pass
/t?tab=chart	/t?tab=chart	Pass
/t?tab=flow	/t?tab=flow	Pass
/t?tab=gex	/t?tab=gex	Pass
/t?tab=leaps	/t?tab=leaps	Pass
/t?tab=crypto	/t?tab=crypto	Pass
/t?tab=catalyst	/t?tab=catalyst	Pass
/t?tab=bot	/t?tab=bot	Pass
/t?tab=positions	/t?tab=positions	Pass
/t?tab=journal	/t?tab=journal	Pass
/slate	/slate	Pass
/radar	/radar	Pass
/performance	/performance	Pass
/alerts	/alerts	Pass
/how-to	/how-to	Pass
/settings	/settings	Pass
/r/META	/r/META	Pass
/trade-desk (retired)	/slate	Pass
/automations (retired)	/t?tab=bot	Pass
/stock/NVDA (legacy)	/r/NVDA	Pass
/about	/about	Pass
/w	/w	Pass

Signed-in session, desktop. Each destination navigated in-app; a pass means a real page rendered (no 404, no error boundary, content present) at the expected URL — redirects included.

Part B — Readability and colour

B1. Can people read it?

Figure 3. Share of board text below comfortable sizes, before and after (live NEXUS board). 'Before' for iPhone under 12px is a lower bound (79% were already under 11px).

Why these metrics. Legibility research is consistent on three points the terminal was violating: text under ~12 px on a phone forces zooming; all-caps slows reading of running text because word shapes disappear; and monospace is for aligning numbers, not for sentences. **What changed:** the smallest sizes became tokens (11/12 px at a desk, 12/13 px under a thumb, 320 CSS sizes and 148 inline sizes moved onto them); every sentence — paragraphs and lists — now renders in a proportional face, sentence case, 1.55 line height; numbers, tickers and short labels stay monospace so columns still align.

Metric (live, NEXUS board)	Desktop 1440	iPhone 393
Median text size	11px	13px
Text under 12px	55%	1%
Sentences in all-caps	0%	0%
Sentence line height	1.5	1.5

B2. Colour psychology and colour-blind safety

Figure 4. Before/after swatches: accent, gain, loss, caution.

Pair	Normal vision dE	Deuteranopia dE	Protanopia dE
gain vs loss	124.0 -> 108.7	15.2 -> 49.4	37.9 -> 39.3
accent vs gain	32.7 -> 100.9	26.4 -> 82.5	29.4 -> 82.1
gain vs caution	80.8 -> 83.7	46.7 -> 70.4	37.1 -> 71.6
loss vs caution	71.4 -> 63.4	39.0 -> 28.8	63.9 -> 53.8

Principles applied. (1) **One accent, and it is the brand's blue** — blue reads as calm and trustworthy, which suits a tool people make money decisions in; the old teal sat so close to 'gain' green (dE 33) that a highlighted control read like a profit. (2) **Green and red keep their trading meaning** but move apart for the ~8% of men with red-green colour vision deficiency — mint gain and vermillion loss (dE 15 -> 49 under deuteranopia), and every change also carries a sign or arrow so colour is never the only cue. (3) **Caution is yellow**, clearly separate from loss. (4) **Semantic colours are reserved:** colour means something, so decoration stays neutral. Differences are CIELAB dE with Machado-2009 colour-vision simulation.

B3. Can every page be seen on every device?

Surface	Before (under 1100px)	After
NEXUS board	'Developing' column hidden on iPad; ideas 3rd on phone	All 3 sections; Active Book first
GEX	both side columns hidden	stacked below the main view
LEAPS · CRYPTO · BOT · CATALYST	right column hidden	stacked
CHART · FLOW	sidebar hidden	stacked after the main view
Board stat tiles / signal levels	5-up grid, labels cut ('AVG EVIDEN', 'SESSIO')	2-up / 3-up reflow, full labels
Top bar (desktop)	wrapped onto two lines after the type increase	one line; nav scrolls in place

C. Open items

Item	Why it matters	Next step
27% of sentences still monospace	They sit in generic containers, not paragraphs	Mark prose containers; same rule applies
44% of all text uppercase	Fine for short labels; tiring in bulk	Sentence-case section labels over 3 words
Active Book ~9,400px long on a phone	Long scroll before market context	Show top 6 + 'show all' on phones
Data-heavy screens LCP 3-15s	One vCPU shared with scanners (v3)	2 vCPU or scanner throttling; one board endpoint
